

Firewall Configuration Report — Task 4

Analyst: Arshiya Sulthana

Date: 27-09-2025

Tool Used: Windows Defender Firewall with Advanced Security

Target System: Localhost (Windows)

1. Objective

To configure and test basic firewall rules in Windows, demonstrating how to block or allow network traffic.

2. Steps Performed

- Opened **Windows Defender Firewall with Advanced Security** console.
 - Reviewed existing **Inbound Rules** to observe default configuration.
 - Created a new inbound rule to **block TCP port 23 (Telnet)**:
 - Type: **Port**
 - Protocol: **TCP**
 - Port: **23**
 - Action: **Block the connection**
 - Profile: **Domain, Private, Public**
 - Rule Name: *Block Telnet Port 23 (Test Rule)*
 - Verified that the rule appeared in the firewall inbound rules list.
 - Deleted the rule to restore the firewall to its original state.
-

3. Observations

- The custom firewall rule successfully appeared in the inbound rules list.
- Port 23 (Telnet) was blocked, ensuring that insecure Telnet connections would be denied if attempted.
- After deletion of the rule, the firewall returned to its default configuration.

4. Conclusion

This task demonstrated how **firewall rules control network traffic** by blocking or allowing packets based on protocol, port, and direction. By blocking Telnet (port 23), we simulated how a firewall prevents insecure communication. Restoring the firewall ensured no long-term impact on the system.
